Health and human rights

Sudan: a war against the people

The current emphasis on combating worldwide terrorism should not obscure other serious human rights issues, such as the 18-year-old war in Sudan. This war has claimed the lives of 2 million people and has left 4 million people displaced. It is one of the longest and most ignored conflicts since World War II. At the root of this brutal war waged by the Islamic military regime in Khartoum against black African southerners is a struggle for resources. Oil, which has been flowing steadily in Sudan since 1998, has leveraged the government’s capacity to wage war against its own people. The international community should increase pressure on the Sudanese government to end the use of oilfields and their revenues for war purposes, and instead take positive steps towards peace.

For the past year, government forces have carried out a ruthless campaign aimed at depopulating large oil-rich areas of the country. In the process, tens of thousands of civilians have been killed, maimed, or displaced from areas around oil fields. By allowing the airstrips and roads in oil fields to be used by the government forces, foreign oil companies have been complicit in the human-rights abuses carried out by the Sudanese regime.

Several human rights organisations have called on foreign companies from Canada, Sweden, China, France, and Austria to suspend their operations in Sudan. In a damning report Winning Oil, Losing People, Amnesty International details the human rights abuses committed by government forces. According to this report, since early 1999, thousands of people have been terrorised into leaving their homes in Western Upper Nile. Government forces have used high-altitude bombardment, helicopter gun-ships, and massive destruction to force civilians to flee their homes.

We collected data on all deaths reported by the families. Information on family members lost or taken away by the militia was also collected. A total of 270 families were surveyed, representing 1027 individuals (three to four individuals per family), of which 201 (20%) were children younger than age 5 years. During the period investigated, 168 deaths were reported (13% of the initial population [1314] under study) of which 24 (11%) were children younger than 5 years of age. 94% (158 of 168) of all deaths, and 79% (19 of 24) of under 5 deaths were due to violence, from mainly gun-shot wounds. 9% (119 of 1314) of the initial population had disappeared, the majority abducted by the militia as hostages, but others lost and separated during the displacement. Analysis of sex distribution was possible for 121 families reporting 44 disappearances: women represented 21% (nine of 44) of the total, including one girl younger than 5 years old. It was not possible for us to analyse sex distribution among reported deaths as the survey was done under difficult emergency conditions. All violent deaths and disappearances we documented occurred on Jan 21, 2001.

Although the proportion of deaths recorded may have been overestimated, the situation we report clearly highlights an unacceptable level of killings perpetrated in part against civilians. In particular, the death of children is intolerable. Families claimed that nearly all of the disappearances, and notably disappearances of women, were abductions.

The secondary health effects of war such as malnutrition, population displacement, and disease outbreaks are often documented as an essential feature of programme planning of aid agencies. Less, however, is known about the primary impact of war through violence on civilians and data is often impossible to collect under such insecure circumstances. Bahr El Ghazal province has been severely affected by famine in the past years, but this should not obscure the dramatic impact of violence in this war-torn region. The example of violence among the displaced from Titcok Mareng village provides a small insight into some of the human rights abuses being perpetrated in southern Sudan. In the context of ongoing war in Sudan and elsewhere, investigations to document and quantify violence among forcibly displaced civilians must be carried out. Such data will have an impact on the prevention of abuses against vulnerable populations in the future.
